

Increase efficiency and lower costs! No more printing, copying, faxing, scanning or archiving paper documents: the whole process, from the creation to the archiving of a document, can be done simply and efficiently with the help of electronic signatures.

General Information on E-signatures

Around 95% of all transactions within the German legal sphere may vary in form, meaning that the documents in question can be signed either by hand or electronically, using a signature pad.

When you sign on a signature pad, both the image and the signature's individual biometric data (e.g. writing pressure and speed) are recorded. This data is securely encrypted, integrated into and inextricably linked with the document to be signed.

The combination of signature pads and StepOver signature capture software not only ensures maximum security, but also the ability to prove the signature's authenticity, as well as comfortable user handling.

StepOver - naturaSign Pad Series

The range of StepOver models covers all your possible needs - from the small, robust field-work pad, with its black and white screen, to the counter/checkout model, with its 5.6-inch colour screen – and allows signatures, text, graphics and interactive buttons to be displayed in real time.

All StepOver signature pads are developed and manufactured in Germany.

Hardware & Software

So that e-signatures could be used on IGEL terminals, StepOver developed a Linux interface which facilitates communication with naturaSign signature pads. A TCP component transmits the data captured from the signature pad to a central server, where the corresponding software application is installed.

StepOver signature pads from the naturaSign series are supported by all models in the current IGEL hardware series. Any devices that have previously been converted with IGEL UDC2 standardisation software are also supported. Signature pads can be connected to any IGEL client via USB.

The whole IGEL hardware and software range is highly efficient, scalable and can also be managed remotely. The industry-leading Universal Management Suite (UMS) is included free upon delivery to the customer. All IGEL hardware and software customers can connect to the leading Virtual Desktop Infrastructure (VDI) and Terminal Server solutions.

This comprehensive, high-performance naturaSign signature pad package, in conjunction with the full IGEL product portfolio, broadens the range of customer-specific solutions at the counter or checkout. The product plays a big part in standardisation and automation procedures from its launch and throughout day-to-day operations, helping towards cost optimisation and heightening security, as no local company data is saved on the terminals.
